# Introduction

- Subject of this work:
  - Find the parameters of FlowSort, a sorting method,
  - Applied to interval sorting.
- This presentation follows a first contribution, available as a Technical Report, considering the case of « standard » sorting.

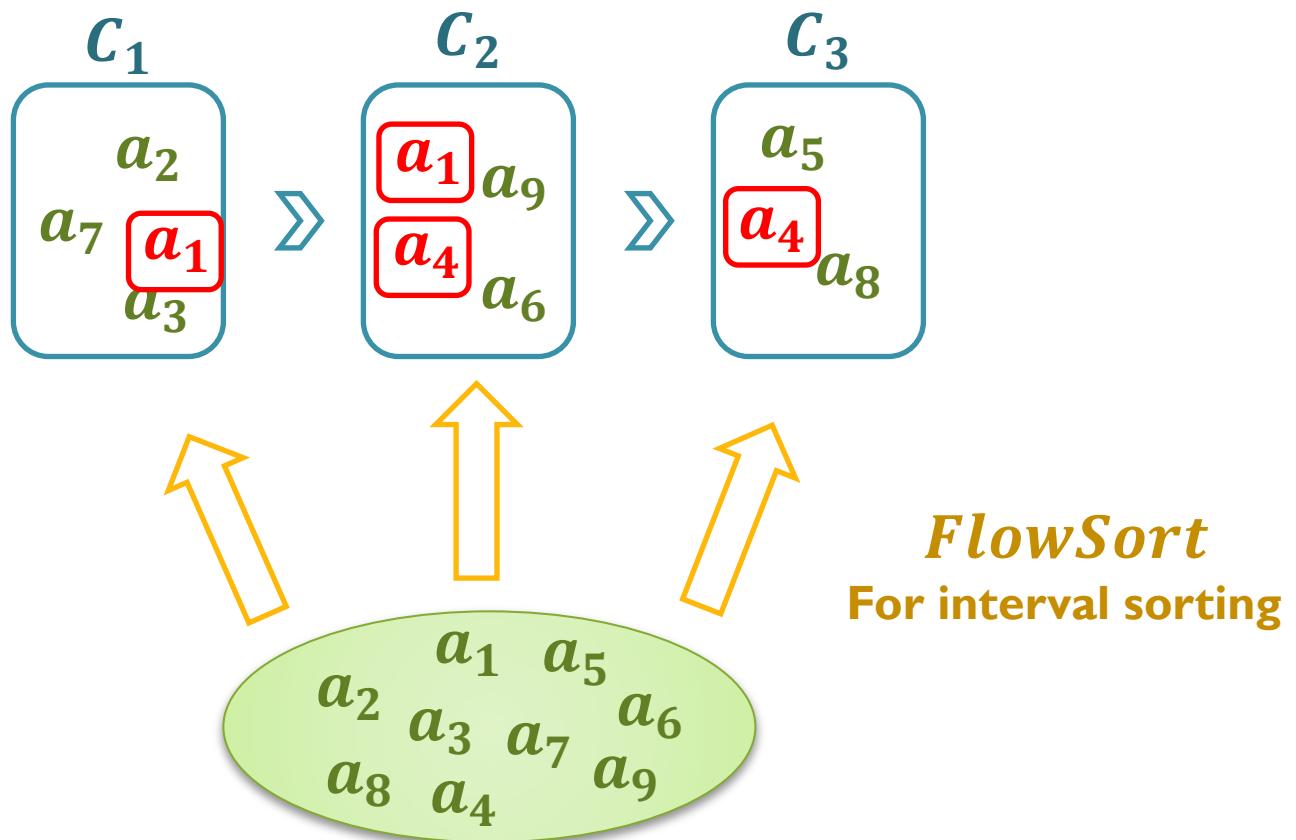

# Sorting

- An alternative belongs to a single category.

# Interval Sorting

- An alternative belongs to an interval of categories.

# FlowSort

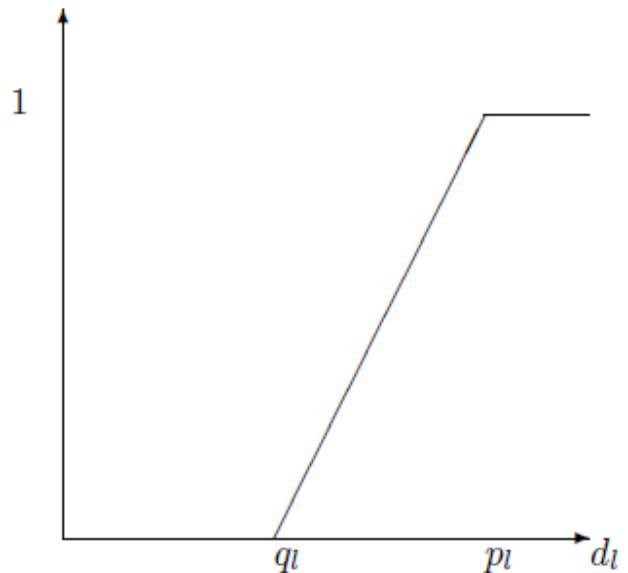

- Sorting method based on PROMETHEE.
- 2 methods :
  - « Standard » sorting: based on PROMETHEE II;
  - Interval sorting: based on PROMETHEE I.

# FlowSort: Sorting with Promethee

- A set of alternatives  $A = \{a_1, a_2 \dots, a_n\}$ ;
- A set of criteria  $F = \{f_1, f_2 \dots, f_q\}$ ,  
 $f_l(a): A \rightarrow \mathbb{R}$ : the evaluation of the alternative  $a$  on criterion  $l$ .
- A preference function  $P_l(x): \mathbb{R} \rightarrow [0,1]$  is assigned to each criterion  $l$ .

# FlowSort: Linear preference function

- 2 parameters:
  - $q_l$ : indifference threshold;
  - $p_l$ : preference threshold;
- $w_l$ : weight of the criterion.

- $P_l(x) = \begin{cases} 0, & x < q_l \\ \frac{x-q_l}{p_l-q_l}, & q_l \leq x < p_l \\ 1, & x \geq p_l \end{cases}$

# FlowSort: PROMETHEE

- Preference degree on criterion  $l$ :

$$\pi_l(a_i, a_j) = P_l(f_l(a_j) - f_l(a_i))$$

- Global preference degree of  $a_i$  over  $a_j$ :

$$\pi(a_i, a_j) = \sum_l w_l \cdot \pi_l(a_i, a_j)$$

# FlowSort: PROMETHEE

- Positive flow score:

$$\phi^+(a_i) = \frac{1}{n-1} \sum_{x \in A} \pi(a_i, x)$$

- Negative flow score:

$$\phi^-(a_i) = \frac{1}{n-1} \sum_{x \in A} \pi(x, a_i)$$

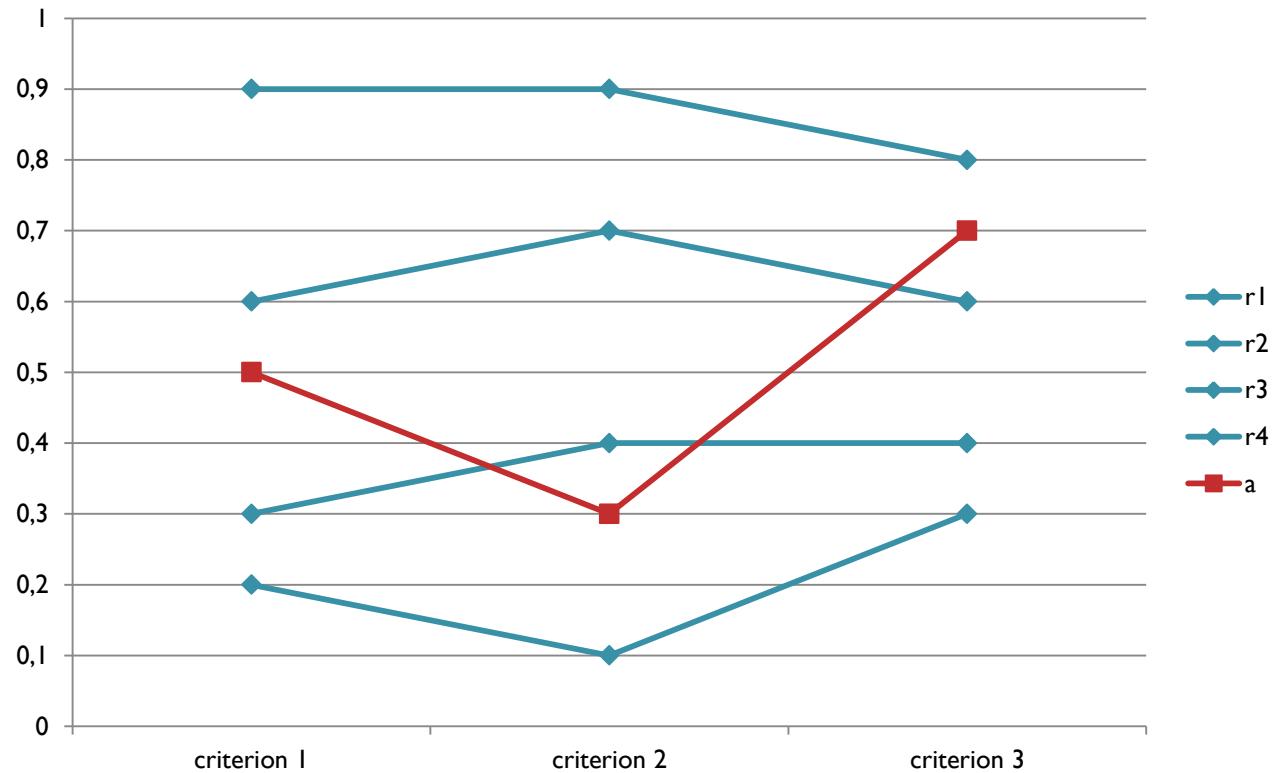

- Net flow score:

$$\phi(a_i) = \phi^+(a_i) - \phi^-(a_i)$$

# FlowSort

- Extension of PROMETHEE to sorting;
- A set of predefined ordered categories  
 $C = \{c_1, c_2 \dots, c_m\}$ ,  $c_1 \succ c_2 \succ \dots \succ c_m$ ;
- A set of central profiles  
 $R = \{r_1, r_2 \dots, r_m\}$  representing the categories;
- Let's define  $R_i = R \cup \{a_i\}$ .

# Example

# FlowSort

- Assignment rule:

$$h^*(a_i) = \operatorname{argmin}_{h=1,2,\dots,m} |\phi_{R_i}(a_i) - \phi_{R_i}(r_l)|$$

- Assignment rule for interval sorting:

$$h^{+*}(a_i) = \operatorname{argmin}_{h=1,2,\dots,m} |\phi^{+}_{R_i}(a_i) - \phi^{+}_{R_i}(r_l)|$$

$$h^{-*}(a_i) = \operatorname{argmin}_{h=1,2,\dots,m} |\phi^{-}_{R_i}(a_i) - \phi^{-}_{R_i}(r_l)|$$

$$\text{Interval : } [h^{-*}(a_i), h^{+*}(a_i)]$$

# Algorithm

- A Genetic Algorithm has been used.
- Problem: find the set of parameters that minimizes the distance of the categorization computed with these and the real one.

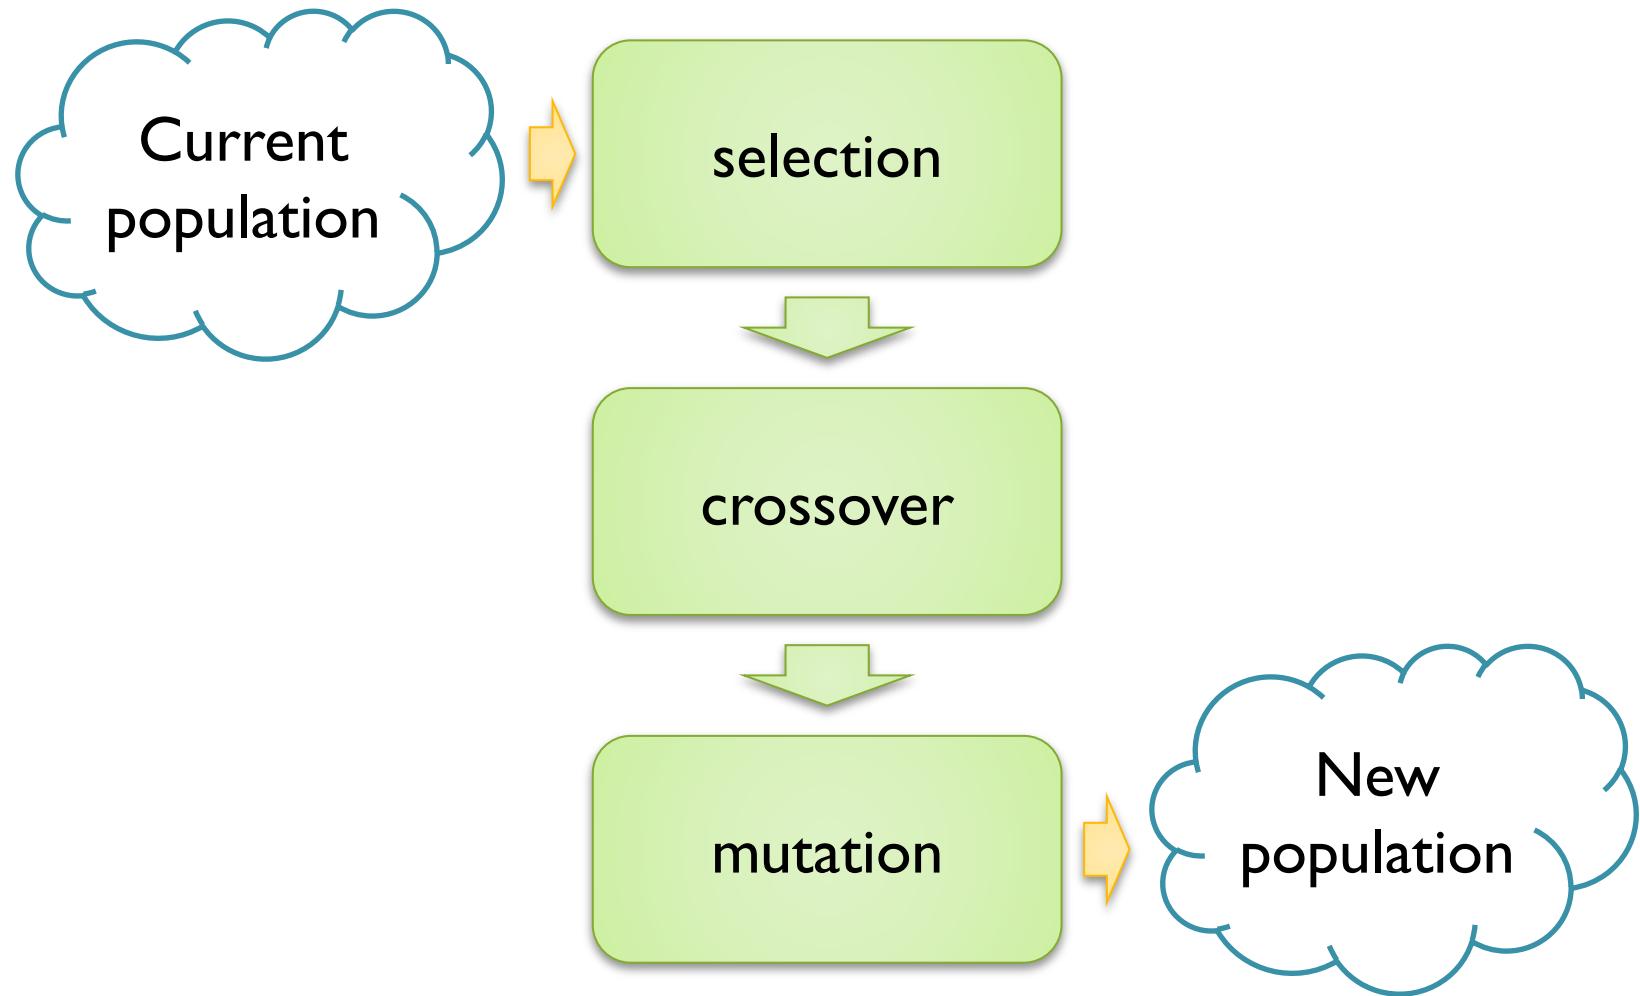

$$\sum_{a \in A} (|c_f^+(a) - c_r^+(a)| + |c_f^-(a) - c_r^-(a)|)$$

# Algorithm: parameters to find

	$Crit_1$	$Crit_2$	$Crit_3$	...	$Crit_q$
<b>Weight</b>	$w_1$	$w_2$	$w_3$	...	$w_q$
<b>q (indifference)</b>	$q_1$	$q_2$	$q_3$	...	$q_q$
<b>p (preference)</b>	$p_1$	$p_2$	$p_3$	...	$p_q$
$r_1$	$r_{11}$	$r_{12}$	$r_{13}$	...	$r_{1q}$
$r_2$	$r_{21}$	$r_{22}$	$r_{23}$	...	$r_{2q}$
$r_3$	$r_{31}$	$r_{32}$	$r_{33}$	...	$r_{3q}$
...	...	...	...	...	...
$r_m$	$r_{m1}$	$r_{m2}$	$r_{m3}$	...	$r_{mq}$

$(3 + m) * q$  parameters to find

# Genetic algorithm overview

# Selection operator

- Random pick of 2 solutions.
- Randomly choose one of both with a probability related to its fitness. (roulette wheel selection)

# Crossover operator

- 2 parameters:
  - crossover probability,
  - gene crossover probability.
- Crossover of 2 solutions with a randomly chosen  $\lambda$ :

$$O_1(i) = \lambda * p_1(i) + (1 - \lambda) * p_2(i)$$

$$O_2(i) = (1 - \lambda) * p_1(i) + \lambda * p_2(i)$$

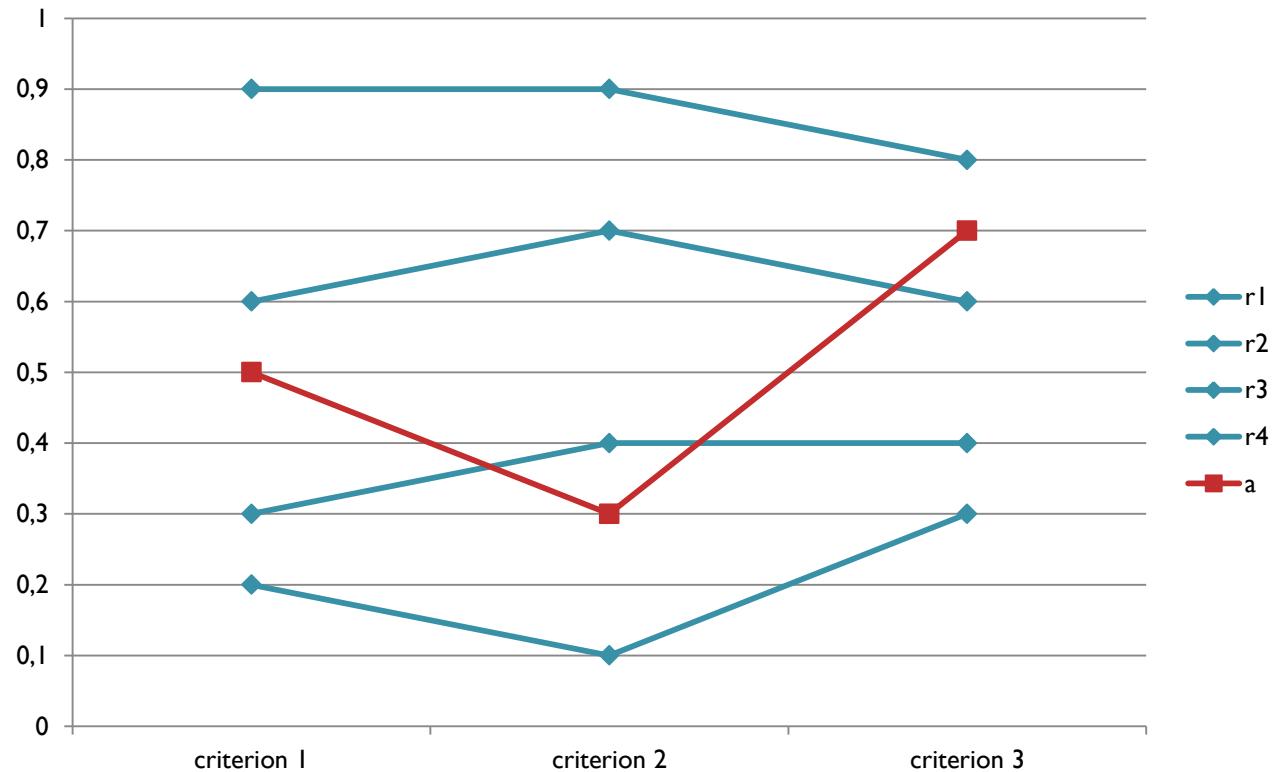

# Solution pattern

	$Crit_1$	$Crit_2$	$Crit_3$	...	$Crit_q$
Weight	$w_1$	$w_2$	$w_3$	...	$w_q$
Q (indifference)	$q_1$	$q_2$	$q_3$	...	$q_q$
P (preference)	$p_1$	$p_2$	$p_3$	...	$p_q$
$r_1$	$r_{11}$	$r_{12}$	$r_{13}$	...	$r_{1q}$
$r_2$	$r_{21}$	$r_{22}$	$r_{23}$	...	$r_{2q}$
$r_3$	$r_{31}$	$r_{32}$	$r_{33}$	...	$r_{3q}$
...	...	...	...	...	...
$r_m$	$r_{m1}$	$r_{m2}$	$r_{m3}$	...	$r_{mq}$

# Mutation operator

- 2 parameters:
  - mutation probability,
  - gene mutation probability.
- For each profile's values:
  - mutation depends on the percentage of overcategorization w.r.t. undercategorization of the category.
- Mutation range restricted with respect to the current correctness of the solution.

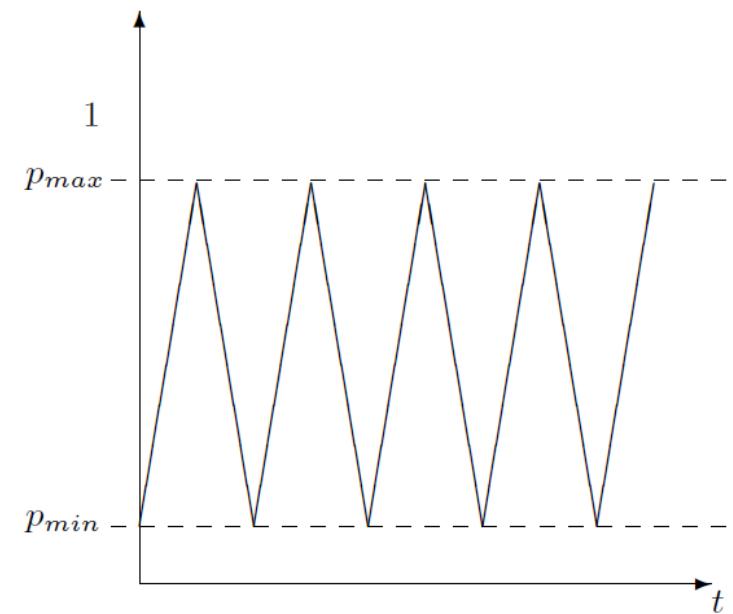

# Mutation operator

# Parameters' fine tuning

- 5 parameters (mutation probability, crossover probability, etc)
- Use of varying parameters between  $p_{min}$  and  $p_{max}$  with a certain angle.

- Less stuck in local optima.

# Testing procedure

- 3 datasets have been chosen : CPU, BC, CEV.
- Interval sorting has been generated with a random parameters instantiation of FlowSort.

---

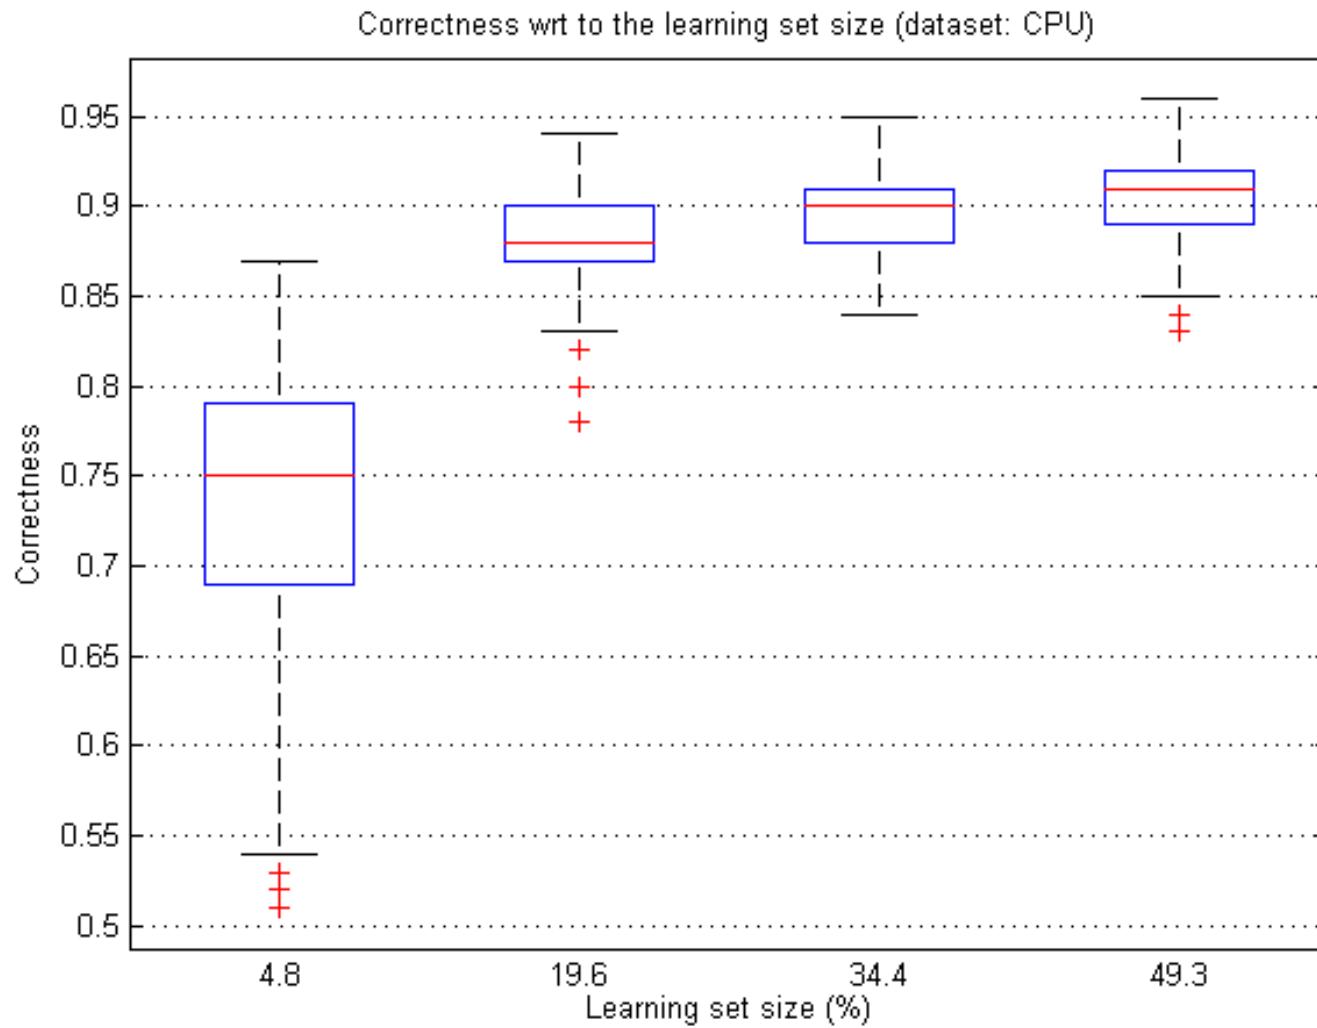

Dataset	#inst.	#crit.	#cat.	#param.	%imprecise cat.
CPU	209	6	4	42	40.67
BC	278	7	2	35	23.02
CEV	1728	6	4	42	16.43

---

# Results

<b>Learning set's size</b>	<b>Dataset</b>	<b>Correctness</b>	<b>Learning set correctness</b>
5%	CPU	$0,7337 \pm 0,0705$	$1,0000 \pm 0,0000$
	BC	$0,8827 \pm 0,0337$	$0,9981 \pm 0,0120$
	CEV	$0,8498 \pm 0,0224$	$0,9227 \pm 0,0383$
20%	CPU	$0,8798 \pm 0,0245$	$0,9880 \pm 0,0160$
	BC	$0,9463 \pm 0,0209$	$0,9955 \pm 0,0103$
	CEV	$0,8809 \pm 0,0173$	$0,8554 \pm 0,0338$
35%	CPU	$0,9004 \pm 0,0215$	$0,9642 \pm 0,0243$
	BC	$0,9579 \pm 0,0210$	$0,9919 \pm 0,0110$
	CEV	$0,8868 \pm 0,0154$	$0,8395 \pm 0,0277$
50%	CPU	$0,9065 \pm 0,0228$	$0,9581 \pm 0,0214$
	BC	$0,9747 \pm 0,0163$	$0,9913 \pm 0,0111$
	CEV	$0,8944 \pm 0,0168$	$0,8309 \pm 0,0252$

# Correctness w.r.t. learning set's size

# Conclusion

- Good overall learning set correctness.
- Good prediction on the tests sets.
- Running time rather small, moreless 5 minutes for the dataset CPU on a modern computer.
- Dataset CEV seems more difficult.

# Future research

- Defining benchmark datasets for interval sorting;
- Try to use an exact method for a simplified version of the model (linear version of PROMETHEE);
- Comparing different methods to investigate which one performs better on which kind of dataset;
- Deepen the idea of « partial » information.
