SQL Server Triggers
Database triggers

A database trigger is *procedural code* that is automatically executed in response to certain *events* on a particular table or view in a database.

The trigger is mostly used for maintaining the *integrity* of the information on the database.
SQL Server triggers

In SQL Server, triggers are executed directly after an **instruction** (i.e. not after each row or each transaction).

<table>
<thead>
<tr>
<th>SSN</th>
<th>Lab</th>
<th>Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>6789</td>
<td>1</td>
<td>30 000</td>
</tr>
<tr>
<td>5555</td>
<td>2</td>
<td>40 000</td>
</tr>
<tr>
<td>4321</td>
<td>1</td>
<td>43 000</td>
</tr>
<tr>
<td>7777</td>
<td>4</td>
<td>25 000</td>
</tr>
</tbody>
</table>

```
UPDATE Employee
SET Salary = 0
WHERE Lab = 1;
```
SQL Server trigger types

- **AFTER triggers** are executed after the instruction takes place.

- **INSTEAD OF triggers** do not execute the triggering instruction, but executes custom code in place of it.
SQL Server triggers

Syntax

create trigger <name>
on <table>
{after|instead of} <list of events>
as
<transact-SQL-statements>

Possible events: insert, delete, update
Inside the `<transact-SQL-statements>`, special tables allow accessing the *newly created* and the *deleted* rows.

**Special tables**

- **Inserted**: new or updated rows of the triggering transaction
- **Deleted**: deleted rows (or old state for updates) of the triggering transaction

Note that, since the trigger is executed at instruction level, these tables can contain many rows.
SQL Server triggers

Employee

<table>
<thead>
<tr>
<th>SSN</th>
<th>Lab</th>
<th>Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>6789</td>
<td>1</td>
<td>30 000</td>
</tr>
<tr>
<td>5555</td>
<td>2</td>
<td>40 000</td>
</tr>
<tr>
<td>4321</td>
<td>1</td>
<td>43 000</td>
</tr>
<tr>
<td>7777</td>
<td>4</td>
<td>25 000</td>
</tr>
</tbody>
</table>

Inserted

<table>
<thead>
<tr>
<th>SSN</th>
<th>Lab</th>
<th>Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>6789</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>4321</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

Deleted

<table>
<thead>
<tr>
<th>SSN</th>
<th>Lab</th>
<th>Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>6789</td>
<td>1</td>
<td>30 000</td>
</tr>
<tr>
<td>4321</td>
<td>1</td>
<td>43 000</td>
</tr>
</tbody>
</table>

UPDATE Employee
SET Salary = 0
WHERE Lab = 1;
Two possible actions

When a constraint violation is detected, two types of actions are possible:

Abort
The transaction is cancelled with a rollback statement and an error is raised.

Repair
An update statement modifies the database to make it consistent with the integrity constraints.
Example of a trigger

Consider two relations:

- **Employee (Name, Salary, Department)**
  
  with Department referencing Department.DeptNo

- **Department (DeptNo, Manager)**

  with Manager referencing Employee.Name

We want to ensure that the salary of an employee cannot be greater than that of his manager.

**What are the events that could bring this rule to be violated?**
Example of a trigger

- Employee (Name, Salary, Department)
- Department (DeptNo, Manager)

We want to ensure that the salary of an employee cannot be greater than that of his manager.

Constraint violating events:
- When adding an employee
- When modifying an employee’s salary
- When modifying an employee’s department
- When modifying department’s manager
Example of an **aborting** *after insert* trigger

```sql
create trigger Emp-insertion-abort
on Employee
after insert
as
if exists(
    select *
    from Inserted I,
        Department D,
        Employee Mgr
    where I.DeptNo = D.DeptNo
    and D.Manager = Mgr.Name
    and Mgr.Salary < I.Salary )
begin
    raiserror 13000 'The salary of an employee cannot be greater than that of his manager'
    rollback
end
```
Active Databases

Exercises
Training on your own machine:

► For windows:
  ► Server: SQL Server Express
  ► GUI: Azure studio or SQL Server Management Studio or DataGrip

► For mac: Follow this tutorial. Note that for the GUI, you can also use DataGrip.

► For linux:
  ► Server: SQL Server. While choosing the ”edition”, please select the free ”Express” edition.
  ► GUI: Azure studio or DataGrip. To connect to your SQL Server express, please indicate server: ”localhost”, login: ”SA” and the password selected during the installation of SQL Server.
Loading the data set

Available on the labs web page:

http://cs.ulb.ac.be/public/teaching/infoh415/tp

Set-up

- Open and run createDB.sql
- Open and run loadDB.sql
We suppose that the database is initially *consistent*.

**Steps**

1. Determine when a constraint can be violated.
2. Then, decide on an action to be taken: *abort* or *repair*.
3. Write the trigger.
4. Test the trigger, by editing the data in a way that violates the constraint.
